

AI Codebase Planner & Execution Prompt

Phase 2: Bug Fixes, UI/UX Refinement, & Profile Overhaul

Context for AI: You are a Senior Codebase Planner and Architect working on a React-based chat application. The user has outlined 6 new issues/features focusing on UX improvements, bug fixes in media rendering, and a profile modal overhaul. Please analyze the requests below, map them to the corresponding components, and create a precise, actionable implementation plan.

Required Fixes & Feature Implementations

1. Shared Media & Links Gallery Bug Web

- **Issue:** In the chat settings (for both 1-on-1 and Group chats), opening the shared files, images, or links section results in a rendering error or broken assets.
- **Action:** Debug the media parsing and rendering logic in the shared gallery component. Ensure proper URLs are passed and the UI handles missing or loading assets gracefully without crashing.

2. Call Log Indicators in Chat Web

- **Issue:** Ended calls simply show as "Call ended - [duration]". There is no visual distinction between audio and video calls.
- **Action:** Update the system message for ended calls. It must explicitly state whether it was a "Voice Call" or "Video Call" (e.g., "Video call ended - 01:03"). Add corresponding UI icons (a phone icon for voice, a video camera icon for video) next to the call duration.

3. Toast Notification Repositioning Web

- **Issue:** Global toast notifications currently appear at the bottom-right corner, which looks unprofessional.

- **Action:** Modify the global toast/notification provider configuration. Move the anchor position to the **Top-Center** of the screen. Ensure proper z-index and smooth slide-in/out animations.

4. Notification Permission Logic Flow Web & Mobile

- **Issue:** The app requests push notification permissions as soon as a user visits the app for the first time. This is bad UX.
- **Action:** Refactor the permission request trigger. The prompt asking to enable notifications must **only** appear *after* the user has successfully registered or logged in for the first time. It should never trigger on the public landing/login pages.

5. Sidebar Header UI Consolidation Web

- **Issue:** The top-left header of the sidebar (above the search bar) has too many separate action icons (e.g., "New Chat", "New Group", etc.), making it cluttered.
- **Action:** Consolidate these actions. Remove the multiple icons and replace them with a single, clean primary action button (e.g., a simple "+" icon or a "New" button). Clicking this button should open a dropdown or a modal presenting the options to "Create New Chat" or "Create New Group". Refactor the layout to be clean and intuitive.

6. Profile Modal Overhaul & Bio State Bug Web

- **Bug Fix:** Fix the issue where saving the "Bio" (tiểu sử) works the first time, but disappears when opening the profile again. Bind the bio text input properly to the saved state/database value.
- **UI Redesign:** Redesign the User Profile Modal to closely mimic the modern floating card layout (similar to Zalo's profile card, showing cover photo, avatar, name, and details list below).
- **Access Control:**
 - **Self Profile:** Include an "Edit" button to allow modifying details (Bio, Avatar, etc.).
 - **Other's Profile:** Make it view-only (no edit buttons).

- **Field Removal:** Completely remove the "Date of Birth" (Ngày tháng năm sinh) field from the profile editing and viewing interfaces. Do not allow users to add or view this.

Instructions for the AI Codebase Planner:

1. Analyze each of the 6 points and identify the exact React components, hooks, or backend endpoints that need modification.
2. Provide Claude (the coding agent) with a strictly ordered checklist.
3. Pay special attention to point #4, ensuring the state logic works for both React Web and React Native (Mobile) environments.
4. Generate the necessary CSS/Tailwind changes for the UI overhauls (Sidebar header and Profile Modal).
