

AI Codebase Planner & Execution Prompt

Phase 3: Authentication, Media Persistence & Core UX Fixes

Context for AI: You are a Senior Codebase Planner and Architect working on a web-based chat application. The user has outlined 6 crucial new issues focusing on session management, UI state persistence, and routing. **All fixes must be applied strictly to the WEB platform.** Please create a precise, actionable implementation plan for Claude (the coding agent) based on the requirements below.

Required Fixes & Feature Implementations

1. Reaction Notification in Chat Sidebar

Web

- **Issue:** Currently, message reactions aren't surfaced in the chat list.
- **Action:** Update the sidebar chat list preview subtitle. When another user reacts to the current user's message, display: "[User] reacted to your message". Ensure this updates in real-time.

2. Critical Auth Fix: Sudden Logout (Token Expiry)

Web

- **Issue:** Users are abruptly kicked out of the app mid-conversation due to access token expiration. This is a severe UX flaw.
- **Action:** Implement silent authentication / seamless token refreshing. Configure HTTP interceptors (e.g., Axios) to catch 401 Unauthorized errors, automatically use the refresh token to get a new access token, and retry the failed request without logging the user out.

3. Privacy Policy Link Routing

Web

- **Issue:** The "Privacy Policy and Security" link on the Registration/Login page is broken or inaccessible.

- **Action:** Fix the routing configuration or link path so users can successfully navigate to the Privacy Policy page from the auth screens.

4. Avatar & Cover Photo Persistence + Cropper Web

- **Bug Fix:** Avatar changes do not persist (they revert to the old one immediately when navigating back to chat). Bind the global state properly to the database update.
- **Feature:** Implement the logic to allow users to upload and change a cover photo.
- **UX Improvement (Cropper Modal):** Both Avatar and Cover Photo uploads must open a **Preview/Cropper Modal** before applying. Allow the user to adjust the image, click a "Confirm" button within the modal, and then require the user to explicitly click a final **"Save Changes"** button on the profile form to commit changes to the backend.

5. Mobile-Web Navigation Bug Web

- **Issue:** On the responsive web version (mobile browser view), tapping "Personal Profile" or "Settings" does not trigger navigation to those views.
- **Action:** Fix the click/tap event handlers and routing logic for the responsive navigation menu so these links successfully route the user to the corresponding pages.

6. Global Chat Search Scope Web

- **Issue:** The sidebar search bar currently only filters/finds Group Chats. It fails to find 1-on-1 personal conversations.
- **Action:** Update the search filter logic. The query must search through both Group names AND individual User names/nicknames in 1-on-1 chats and render them correctly in the search results list.

Instructions for the AI Codebase Planner:

1. Review the Auth implementation (e.g., HTTP interceptors, Auth Context) to properly structure the silent refresh token logic (Task 2).
2. Identify the state management flow for user profiles to fix the Avatar/Cover persistence issue (Task 4). Detail the creation of an Image Cropper component.
3. Output a strict, step-by-step checklist detailing which specific files to modify and the exact logic needed.
