

# AI Codebase Planner & Execution Prompt

**Project:** Chat Application Refinement & Feature Implementation

**Context for AI:** You are a Senior Codebase Planner and Architect. I am building a chat application. Currently, there are UI/UX inconsistencies and missing functionalities compared to standard messaging apps like Facebook Messenger. Please analyze the following requirements, check the relevant files in the codebase, and create a comprehensive, step-by-step execution plan for the coding agent (Claude) to implement these fixes.

## Required Fixes & Feature Implementations

### 1. Chat List Sidebar Preview & System Messages UI

**Target Platform:** Web & Mobile

- **Message Preview Logic:** In the left sidebar chat list, update the subtitle (message preview). For 1-on-1 chats: If the current user sent the last message, display `"You: [message]"`. If the other user sent it, display only `"[message]"`.
- **System Messages Formatting:** Absolutely **DO NOT** display raw system codes, JSON objects, or file paths in the UI (e.g., currently showing `system.theme.changed:/api/upload...` or raw JSON). Map backend system events to clean, professional human-readable text (e.g., "User changed the theme", "Group was created"). Apply this to both the sidebar preview and the main chat area.

### 2. Chat Background Upload & Interactive Preview Modal

**Target Platform:** Web & Mobile

- **Bug Fix:** Fix the current issues preventing chat background images from uploading correctly.
- **New Feature (Live Preview):** When a user uploads a new background image, do not apply it immediately. Instead, open a **Preview Modal**.

- This modal must show a mockup chat interface with dummy messages overlaying the newly uploaded background.
- Allow the user to adjust, crop, or scale the image within this preview modal.
- Only when the user clicks "Submit/Save", apply the exact cropped/adjusted coordinates as the actual background for that specific conversation.

### 3. Quick Reaction (Emoji) Customization Bug

**Target Platform:** Web

- **Bug Fix:** In the chat settings, the "Quick Reaction" (default emoji like 👍) cannot currently be changed to other emojis.
- Fix the state management and API call so the emoji picker correctly updates the quick reaction icon for the conversation in both the UI and the database.

### 4. Nickname Configuration (1-on-1 Chats)

**Target Platform:** Web

- Implement a nickname editing feature mimicking Facebook Messenger.
- In 1-on-1 conversations, a user must be able to change the nickname for **both themselves and the other participant**.
- Ensure the UI reflects the updated nicknames immediately across the chat header, message bubbles, and the chat list sidebar.

### 5. Group Chat Settings UI Parity

**Target Platform:** Web

- The settings menu for Group Chats is outdated compared to 1-on-1 chats.
- Update the Group Chat settings sidebar to match the layout of the standard Messenger-like settings menu (e.g., collapsible sections for Chat Info, Customize Chat, Media/Files, Privacy & Support).

- Ensure **all buttons and toggles** in this new group settings menu are fully functional and wired to their respective API endpoints (Theme changing, Nicknames, Emoji, etc.).

### Instructions for the AI Codebase Planner:

1. **File Discovery:** Identify all relevant components (e.g., `Sidebar.tsx`, `ChatArea.tsx`, `SettingsMenu.tsx`, `MessageBubble.tsx`) and state management/API hook files.
2. **Dependency Check:** Check if we need to install any new libraries (e.g., an image cropper library for Task 2).
3. **Execution Plan:** Output a strictly ordered, step-by-step checklist for the coding agent. Detail exactly which functions to modify, which state variables to add, and how to format the system message parsing logic.
